Create PDF on the fly with PDFsharp

With PDFsharp you can use the same code to draw graphic, text and images on different targets. The object used for drawing is the XGraphics object.

With XGraphics you can draw on a PDF page as well as on any System.Drawing.Graphics object. Use the same code to
- draw on a newly created PDF page
- draw above or beneath of the content of an existing PDF page
- draw in a window
- draw on a printer
- draw in a bitmap image

You can also import an existing PDF page and use it like an image, e.g. draw it on another PDF page.

Imported PDF pages are neither drawn nor printed; create a PDF file to see or print them!
Below this text is a PDF form that will be visible when viewed or printed with a PDF viewer.
